

A 48-year old male patient presented with CC
"My teeth are breaking."

The patient has been suffering from GERD since he was 30, otherwise he is healthy. The patient wears a night guard because he was told by his previous dentist that he had a bruxism.

The patient is financially capable and motivated to receive comprehensive dental treatment. The patient just moved to Portland and visited his new dentist a few months ago. The patient was told by the dentist that all he needed was to place crowns on most of his teeth.

Now, he is visiting you for a second opinion.

1. Would you suggest orthodontic treatment as a part of his treatment plan? (0 point)
2. If you chose to suggest orthodontic treatment, what benefits do you think you can have from orthodontic treatment? / If you chose not to suggest orthodontic treatment, explain why it is not necessary. (3 points)
